

## BUILDING A SMART AI POWERED SPAM CLASSIFIER

To build a smarter AI-powered spam classifier I must give you the difference of spam and non-spam messages .

What is spam messages ?

Spam refers to unsolicited or irrelevant messages, often sent over the internet, especially via email. These messages are typically sent in bulk to a large number of users for advertising, phishing, or other malicious purposes.

What is non-spam messages ?

Non-spam messages, often referred to as “ham,” are legitimate and desired communications. These messages are not unsolicited and typically include personal or business-related content, such as regular emails, messages from colleagues, friends, or newsletters that users have subscribed to willingly.

Example of spam Message :

A message that came from unknown number or unauthorised Site

Example of Non-spam Message :

A message that came from official site and legally authorised number
